

Proficiency Demonstration Schedule

Winter Term 2026

Proficiency demonstrations are conducted live with the instructor. It is preferred that the demo be conducted in-person on campus. If this is not possible for you, then it will be arranged on Zoom.

The following options are available on campus:

Friday, February 13:

1:15 pm (to 1:45 pm) in AC1451 Computer Lab (building 14, downstairs)

Note that this is the same date and location as the CS Info Session, permitting you to attend before or after your proficiency demo, so that students wanting to attend both can do so with a single trip to campus.

Saturday, February 14, choose a time (Please arrive at least 5 to 10 minutes prior):

10:30 am (to 11 am) in AC2600 (building 16, upstairs).

11:00 am (to 11:30) in AC2600 (building 16, upstairs).

11:30 am (to noon) in AC2600 (building 16, upstairs).

Noon (to 12:30 pm) in AC2600 (building 16, upstairs).

12:30 (to 1 pm) in AC2600 (building 16, upstairs).

Note that this is the same date and location as the Code Party, permitting you to attend before and/or after your proficiency demo, so that students wanting to attend both can do so with a single trip to campus.

If none of the above dates/times can work for you, then please choose one of the following Zoom alternatives:

Monday, February 9, choose a time:

1:30 pm (to 1:55 pm) on Zoom

8:45 pm (to 9:15 pm) on Zoom

Monday, February 16, choose a time:

1:30 pm (to 1:55 pm) on Zoom

8:45 pm (to 9:15 pm) on Zoom

Wednesday, February 18:

8:45 pm (to 9:15 pm) on Zoom

Please identify your choice now and put it in your calendar. If none of the above dates/times and locations work for you, please email me by 8 am on Wednesday of Week 5 to alert me that you need a special Zoom appointment and tell me your availabilities outside of my teaching hours (I teach 1:30-9:20 pm MW).

You should be fully prepared before arriving, having practiced coding what might be asked of you. After you arrive, one of three tasks will be asked of you. You will need to start with a blank screen. Raise your hand to show your blank screen to the instructor before you start.

You will have up to thirty minutes to raise your hand again that you are finished with trial-and-error and with debugging and that you want the instructor to see your working code and demonstration that it compiles and runs correctly.

You are allowed unlimited mistakes, but your code must compile and run successfully within the 30 minute period.

CS161:

1. Displays counting numbers 0, 1, 2, 3, ..., 99
2. Displays even numbers: 0, 2, 4, 6, 8, ..., 98
3. Displays odd numbers: 1, 3, 5, 7, ..., 99

And this program should be able to generate a new line character every 10 numbers it displays.

CS162:

1. Declares a pointer and dynamically allocates space for an int, uses it, then deletes it without leaving a dangling pointer.
2. Defines a Point(x, y) struct and overloads + to add two points, yielding (x1 + x2, y1 + y2)
3. Defines a Point(x, y) struct and overloads << to enable the following code to display two point objects:
`cout << "The points are " << pointA << " and " << pointB << endl;`

CS260:

1. Defines a LinkedList class in a LinkedList.h file, implements it in a LinkedList.cpp file, and demonstrates it using a main.cpp. The class must contain
 - a. a Node struct that stores an int (and a next pointer)
 - b. a member function that adds a Node to the list
 - c. a member function that displays all int values stored in the list
2. Lists Fibonacci numbers from the 1st to the 46th, using recursive function calls, where fib(i) returns the ith Fibonacci number, starting with fib(1) = 1 and fib(2) = 1.
3. Defines a Bag class in a Bag.h file, implements it in a Bag.cpp file, and demonstrates it using main.cpp. The project must demonstrate the ability to
 - a. declare two bags with specified quantities of at least five distinct items
 - b. perform bag addition using the + operator
 - c. output the contents of the resulting bag (the sum of bag1 + bag2)
